

# Researchers Beware! The Devil is in the (Mathematical) Models

**Venkatesh Vinayakarao**

[venkateshv@cmi.ac.in](mailto:venkateshv@cmi.ac.in)

<http://vvtesh.co.in>

---

Two Day National Workshop on

**An Insight into Mathematical Modelling in Information and Communication Engineering**

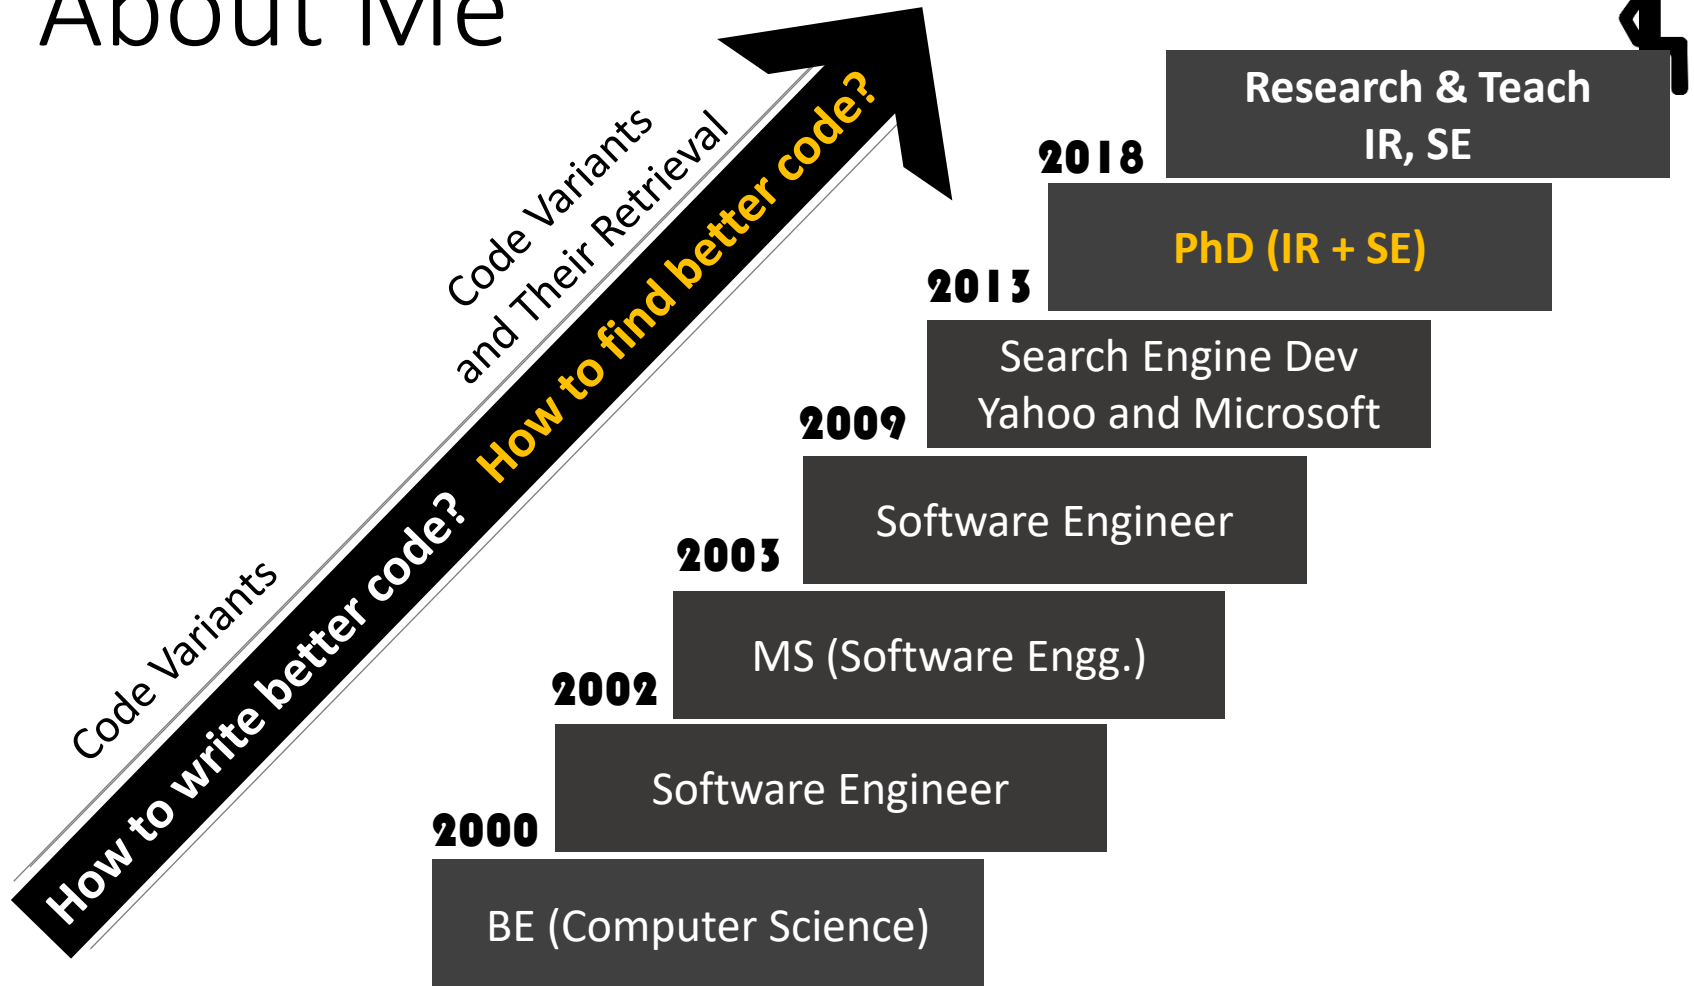

Jointly Organized by Department of CSE and Department of Mathematics  
Sri Sivasubramaniya Nadar College of Engineering

---

Mathematics, the science of structure, order, and relation that has evolved from elemental practices of counting, measuring, and describing the shapes of objects.

Britannica, <https://www.britannica.com/science/mathematics>.

# About Me

# Agenda

## Why should **Researchers** care for **Mathematics**?

### Will Discuss

- ✓ Concepts
- ✓ Illustrations
- ✓ Intuitions
- ✓ Purpose
- ✓ Properties

### Will not Discuss

- ⊗ Details
- ⊗ Definitions
- ⊗ Formalism
- ⊗ Derivations
- ⊗ Proofs

### Three Stories

**Relational Model** in Databases,  
**Vector Space Models** and **Probabilistic Models** in  
Search Engines

# Story 1

Evolution of RDBMS and SQL

Interrelated “Data” as  
a Relation

## The Relational Model

**Edgar F. Codd**

**PhD in Computer Science**

**Winner of the Turing Award**

*“He made other valuable contributions to computer science, but the relational model, a very influential general theory of data management, remains his most mentioned, analyzed and celebrated achievement.”*

— Wikipedia.

# The “Relation” from Math Textbook

- A **relation**  $R$  from a set  $A$  to set  $B$  is a subset of the cartesian product  $A \times B$ .

$$\begin{array}{c} \{\text{blue circle}, \text{black circle}, \text{red circle}\} \\ \text{set A} \end{array} \times \begin{array}{c} \{\text{blue triangle}, \text{red triangle}\} \\ \text{set B} \end{array} = \begin{array}{c} \{ (\text{blue circle}, \text{red triangle}), (\text{blue circle}, \text{blue triangle}), \\ (\text{black circle}, \text{red triangle}), (\text{black circle}, \text{blue triangle}), \\ (\text{red circle}, \text{red triangle}), (\text{red circle}, \text{blue triangle}) \} \\ \text{set of all ordered pairs, } A \times B \\ A \times B = \{ (a, b) \mid a \in A \text{ and } b \in B \} \end{array}$$

---

Let's say a relation exists between the reds

$$\text{Relation RedShapes} = \{ (\text{red circle}, \text{red triangle}) \}$$

# A Relation

- Let the set, **id** = {1,2,3}
- Let the set, **name** = {vv, sd}
- What is **id x name**? \_\_\_\_\_
- We have a **relation** if we assign a sequential id to each name.

id	name
1	sd
1	vv
2	sd
2	vv
3	sd
3	vv

id	name

# The 1981 ACM Turing Award Lecture

Delivered at ACM '81, Los Angeles, California, November 9, 1981

The 1981 ACM Turing Award was presented to Edgar F. Codd, an IBM Fellow of the San Jose Research Laboratory, by President Peter Denning on November 9, 1981 at the ACM Annual Conference in Los Angeles, California. It is the Association's foremost award for technical contributions to the computing community.

Codd was selected by the ACM General Technical Achievement Award Committee for his "fundamental and continuing contributions to the theory and practice of database management systems." The originator of the relational model for databases, Codd has made further important contributions in the development of relational algebra, relational calculus, and normalization of relations.

Edgar F. Codd joined IBM in 1949 to prepare programs for the Selective Sequence Electronic Calculator. Since then, his work in computing has encompassed logical design of computers (IBM 701 and Stretch), managing a computer center in Canada, heading the development of one of the first operating systems with a general multiprogramming capability, contributing to the logic of self-reproducing automata, developing high level techniques for software specifica-

tion, creating and extending the relational approach to database management, and developing an English analyzing and synthesizing subsystem for casual users of relational databases. He is also the author of *Cellular Automata*, an early volume in the ACM Monograph Series.

Codd received his B.A. and M.A. in Mathematics from Oxford University in England, and his M.Sc. and Ph.D. in Computer and Communication Sciences from the University of Michigan. He is a Member of the National Academy of Engineering (USA) and a Fellow of the British Computer Society.

The ACM Turing Award is presented each year in commemoration of A. M. Turing, the English mathematician who made major contributions to the computing sciences.

## Relational Database: A Practical Foundation for Productivity

E. F. Codd  
IBM San Jose Research Laboratory

# Story So Far...

## What is a Relation?

$$\begin{array}{c} \{ \text{blue circle}, \text{black circle}, \text{red circle} \} \\ \text{set A} \end{array} \times \begin{array}{c} \{ \text{blue triangle}, \text{red triangle} \} \\ \text{set B} \end{array} = \begin{array}{c} \{ (\text{blue circle}, \text{red triangle}), (\text{blue circle}, \text{blue triangle}), \\ (\text{black circle}, \text{red triangle}), (\text{black circle}, \text{blue triangle}), \\ (\text{red circle}, \text{red triangle}), (\text{red circle}, \text{blue triangle}) \} \\ \text{set of all ordered pairs, } A \times B \\ A \times B = \{ (a, b) \mid a \in A \text{ and } b \in B \} \end{array}$$

Let's say a relation exists between the reds:

**Relation R = { (red circle, red triangle) }**

# Story 2

Models in Search Engines

Image Source  
[https://philbradley.typepad.com/phil\\_bradleys\\_weblog/2016/07/100-search-engines-logos-image-for-you-to-use.html](https://philbradley.typepad.com/phil_bradleys_weblog/2016/07/100-search-engines-logos-image-for-you-to-use.html)

# Simple Retrieval Problem

- Say, we have a **collection** with 5 **documents**, each having the following contents
  - d1: IIIT ALLAHABAD
  - d2: IIIT DELHI
  - d3: IIIT GUWAHATI
  - d4: IIIT KANCHIPURAM
  - d5: IIIT SRI CITY
- Assume, the **Query** is
  - IIIT SRI CITY
- Which **document** will you match and why?

# The Problem: How to Build a Retrieval System?

# One (bad) Approach

- First match the **term** IIIT.
  - Filter out documents that contain this term.
- Next match the **term** Sri.
  - Filter out documents that contain this term.
- Next match the **term** City.
  - Filter out documents that contain this term.

**Three iterations!**  
**Quiz: Can we do better?**

# Vector

- Geometric entity which has magnitude and direction

$\vec{A}$  is fixed at (0,0)

What is  $(1,1,1)$  ?

# Remember!

**A number is just a mathematical object. We  
give meaning to it!**

# Sentences are Vectors

- “Sri City” as a vector

# Sentences are Vectors

- “**IIIT Sri City**” is a 3-dimensional vector

# Sentences are Vectors

- On this 3D space, “Sri City” vector will lie on the x (City) and z (Sri) plane. If  $(x,y,z)$  denotes the vector, “Sri City” is  $(1,0,1)$ .

# Natural Language Phrases as Vectors

Let query  $q$  = “IIIT Sri City”.

Let document,  $d_1$  = “IIIT Sri City” and  $d_2$  = “IIIT Delhi”.

	IIIT	Sri	City	Delhi
$q$	1	1	1	0
$d_1$	1	1	1	0
$d_2$	1	0	0	1

$q = (1,1,1,0)$ ,  $d_1 = (1,1,1,0)$  and  $d_2 = (1,0,0,1)$

# Quiz

- Considering the following vectors:

	IIIT	Sri	City	Delhi
q	1	1	1	0
d <sub>1</sub>	1	1	1	0
d <sub>2</sub>	1	0	0	1

- What is the Natural Language (NL) equivalent of (0,1,1,0) ?
- What is the vector for Delhi?

# Similarity Score

- Assume, we have the following two documents:
  - $d_1$  = “Chennai”
  - $d_2$  = “Delhi”
- On a scale of 0 – 1, how similar are  $d_1$  and  $d_2$ ?
- What is the angle between  $d_1$  and  $d_2$  vectors?

**Can we express  
similarity as a function  
of the angles?**

0 – 90 to 1 – 0: How?

	0°	30°	45°	60°	90°
sin	0	1/2	1/√2	√3/2	1
cos	1	√3/2	1/√2	1/2	0
tan	0	1/√3	1	√3	Not defined

# Back to Trigonometry: Dot Product

- If  $\mathbf{a}$  and  $\mathbf{b}$  are non-unit vectors, what is the cosine of angle between them ( $\cos \theta$ )?

$$\mathbf{a} \cdot \mathbf{b} = \|\mathbf{a}\| \|\mathbf{b}\| \cos(\theta)$$

(or)

$$\cos(\theta) = \frac{\mathbf{a} \cdot \mathbf{b}}{\|\mathbf{a}\| \|\mathbf{b}\|}$$

# Example

Let query  $q$  = “BITS Pilani”.

Let document,  $d_1$  = “BITS Pilani Goa Campus” and  $d_2$  = “IIT Delhi”.

	BITS	Pilani	Goa	Campus	IIT	Delhi
$q$	1	1	0	0	0	0
$d_1$	1	1	1	1	0	0
$d_2$	0	0	0	0	1	1

In our VSM,  $q = (1,1,0,0,0,0)$ ,  $d_1 = (1,1,1,1,0,0)$  and  $d_2 = (0,0,0,0,1,1)$

$$\text{similarity}(d_1, q) = \frac{d_1 \cdot q}{||d_1|| ||q||} = \frac{1.1 + 1.1}{\sqrt{1^2+1^2+1^2+1^2} \sqrt{1^2+1^2}} = 0.71.$$

$$\text{similarity}(d_2, q) = \frac{d_2 \cdot q}{||d_2|| ||q||} = 0.$$

# An Assumption

**More frequent appearance of a query term  
implies higher document relevance.**

# Which of the Following are Sets?

- {1, 2, 3, 4, 5, 6, 5, 7, 8, 9, 10, 11, 12, 13}
- {A, B, C, D, E, F, G, H, I, I, J, K, L, M, N, O}
- {apple, banana, orange, apple, banana, orange}

Vadivelu, a popular  
tamil actor

# Bag

- {1, 2, 3, 4, 5, 6, 5, 7, 8, 9, 10, 11, 12, 13}
- {A, B, C, D, E, F, G, H, I, I, J, K, L, M, N, O}
- {apple, banana, orange, apple, banana, orange}

# Set of Words Representation

- “IIIT Sri City”  $\rightarrow \{\text{IIIT}, \text{Sri}, \text{City}\}$
- “IIIT Sri City, Sri City”  $\rightarrow \{\text{IIIT}, \text{Sri}, \text{City}\}$   
(Assuming, we ignore the punctuations)

	IIIT	Sri	City
q	1	1	1

# Bag of Words Representation

- “IIIT Sri City”  $\rightarrow \{\text{IIIT}, \text{Sri}, \text{City}\}$
- “IIIT Sri City, Sri City”  $\rightarrow [\text{IIIT}, \text{Sri}, \text{Sri}, \text{City}, \text{City}]$

IIIT Sri City				IIIT Sri City, Sri City			
	IIIT	Sri	City		IIIT	Sri	City
q	1	1	1	q	1	2	2

Leads to different vectors

# Which Document to Retrieve?

	cheap	CDs	DVDs	extremely	software	thrills
$q$	3	2	1	1	0	0
$d_1$	2	2	0	0	1	0
$d_2$	1	0	1	0	0	1

$\text{sim}(q, d_1) = 0.86$

$\text{sim}(q, d_2) = 0.59$

# Story 3

---

A Probabilistic Model

# The Law – Robert M. Coates

From the book, “The World of Mathematics – Volume IV”.

**Triborough Bridge, NY, USA.**  
(aka Robert F. Kennedy Bridge)

Late 1940s, NY: No other bridge or main highway was affected, and though the two preceding nights had been equally balmy and moonlit, on both of these the bridge traffic had run close to **normal**.

And then, one day...

It just looked as if **everybody** in Manhattan who owned a car had decided to drive out to Long Island that evening.

# No Reason!

**Sergeant:** “I kept askin’ them” he said, “Is there night football somewhere that we don’t know about? Is it the races you’re goin’ to?”

But the funny thing was half the time they’d be askin’ me. “What’s the crowd for, Mac?” they would say. And I’d just look at them.

If normal things stop happening, if  
we lose regularities in life, our  
planet could become unlivable!

# Time for Action

- At this juncture, it was inevitable that Congress should be called on for action.

- Senator said, “*You can control it*”. Re-education and reforms were decided upon. He said, (we need to lead people back to) “*the basic regularities, the homely **averageness** of the American way of life*”.

# The Law of Large Numbers

Known as the Fundamental theorem of Probability

**The average of the results obtained from a large number of trials should be close to the expected value, and will tend to become closer as more trials are performed.**

# Probabilistic Retrieval

- Information Need: Taj Mahal
- Let a query  $q$  be “Taj”
- Let the results be:
  - d1: Taj
  - d2: Taj Mahal
  - d3: Taj Tea
- Two judges were asked to provide relevance judgments:

Document	Judge 1	Judge 2
Taj	R	N
Taj Mahal	R	R
Taj Tea	N	N

# Probability of Relevance

- Documents can have probability of being relevant and of being non-relevant at the same time.
- Example:
  - Documents in our collection :

Document	$P(R=0 d,q)$	$P(R=1 d,q)$
Taj	0.5	0.5
Taj Mahal	?	?
Taj Tea	?	?

$R = 0 \rightarrow$  Non-Relevant

$R = 1 \rightarrow$  Relevant

# Probability of Relevance

- Documents can have probability of being relevant and of being non-relevant at the same time.
- Example:
  - Documents in our collection :

Document	$P(R=0 d,q)$	$P(R=1 d,q)$
Taj	0.5	0.5
Taj Mahal	0	1
Taj Tea	1	0

$R = 0 \rightarrow$  Non-Relevant

$R = 1 \rightarrow$  Relevant

# Probability Ranking Principle

**Rank documents by the  
probability of relevance,  
 $P(R=1 | q, d)$   $R \in \{0, 1\}$**

# Probability Ranking Principle

**Rank documents by the  
probability of relevance,  
 $P(R=1 | q, d)$   $R \in \{0, 1\}$**

Document	$P(R=0   d, q)$	$P(R=1   d, q)$
Taj	0.5	0.5
Taj Mahal	0	1
Taj Tea	1	0

$R = 0 \rightarrow$  Non-Relevant

$R = 1 \rightarrow$  Relevant

**Search Result:**

1. Taj Mahal
2. Taj
3. Taj Tea

# Bayes Optimal Decision Rule

d is relevant if  
 $P(R=1 | d, q) > P(R=0 | d, q)$

Document	$P(R=0   d, q)$	$P(R=1   d, q)$
Taj	0.5	0.5
Taj Mahal	0	1
Taj Tea	1	0

**Search Result:**

1. Taj Mahal

# Predicting Relevance

Document	$P(R=0   d, q)$	$P(R=1   d, q)$
Taj	0.5	0.5
Taj Mahal	0	1
Taj Tea	1	0

This is user given relevance.

Can we  
estimate/predict  
relevance based  
on term  
occurrence ?

# Predicting Relevance

- You may use labeled set from judges (or mined from clicklogs)
- You may assume query and document as set of words.

Query	Document	Relevance
q1 = (x1,x2,...)	d1 = (..xi, xj,...)	1
q1	d2	1
q1	d3	0
q2	d1	0
q2	d2	0
q2	d3	1

This is user given relevance.

Can we estimate/predict relevance ?

# Binary Independence Model (BIM)

- Each document is a binary vector of terms.
- Occurrence of terms is mutually independent.

$$P(R = 1|d, q) = \frac{P(d|R = 1, q)P(R = 1|q)}{P(d|q)}$$

Bayes Rule

# Quiz

$$P(R = 1|d, q) = \frac{P(d|R = 1, q)P(R = 1|q)}{P(d|q)}$$

Bayes Rule

- $P(d=\text{Taj} | R=1, q) = ?$
- $P(R=1 | q) = ?$
- $P(d | q) = ?$

Document	$P(R=0   d, q)$	$P(R=1   d, q)$
Taj	0.5	0.5
Taj Mahal	0	1
Taj Tea	1	0

# Quiz

$$P(R = 1|d, q) = \frac{P(d|R = 1, q)P(R = 1|q)}{P(d|q)}$$

Bayes Rule

- $P(d=\text{Taj} | R=1, q) = 1/3$
- $P(R=1 | q) = 1/2$
- $P(d=\text{Taj} | q) = 1/3$

$$P(R=1 | d=\text{Taj}, q) = (1/3)(1/2)/(1/3) = 1/2$$

Document	$P(R=0   d, q)$	$P(R=1   d, q)$
Taj	0.5	0.5
Taj Mahal	0	1
Taj Tea	1	0

# Predicting Relevance

- Odds of Relevance is easier to calculate

$$O(R|\vec{x}, \vec{q}) = \frac{P(R=1|\vec{x}, \vec{q})}{P(R=0|\vec{x}, \vec{q})} = \frac{\frac{P(R=1|\vec{q})P(\vec{x}|R=1, \vec{q})}{P(\vec{x}|\vec{q})}}{\frac{P(R=0|\vec{q})P(\vec{x}|R=0, \vec{q})}{P(\vec{x}|\vec{q})}} = \frac{P(R=1|\vec{q})}{P(R=0|\vec{q})} \cdot \frac{P(\vec{x}|R=1, \vec{q})}{P(\vec{x}|R=0, \vec{q})}$$

Constant term.

- In BIM, we assume that the term occurrence is mutually independent

$$\begin{aligned} \frac{P(\vec{x}|R=1, \vec{q})}{P(\vec{x}|R=0, \vec{q})} &= \prod_{t=1}^M \frac{P(x_t|R=1, \vec{q})}{P(x_t|R=0, \vec{q})} = \prod_{t:x_t=1} \frac{P(x_t=1|R=1, \vec{q})}{P(x_t=1|R=0, \vec{q})} \cdot \prod_{t:x_t=0} \frac{P(x_t=0|R=1, \vec{q})}{P(x_t=0|R=0, \vec{q})} \\ &= \prod_{t:x_t=q_t=1} \frac{p_t}{u_t} \cdot \prod_{t:x_t=0, q_t=1} \frac{1-p_t}{1-u_t} \end{aligned}$$

# Retrieval Status Value

Not document specific.  
Constant for a query.

$$\prod_{t: x_t = q_t = 1} \frac{p_t(1 - u_t)}{u_t(1 - p_t)} \cdot \prod_{t: q_t = 1} \frac{1 - p_t}{1 - u_t}$$

$$\text{RSV} = \prod_{t: x_t = q_t = 1} \frac{p_t(1 - u_t)}{u_t(1 - p_t)}$$

**RSV is used for ranking documents.**

# Summary: Relational Model

## What is a Relation?

$$\begin{array}{c} \{\text{blue circle}, \text{black circle}, \text{red circle}\} \\ \text{set A} \end{array} \times \begin{array}{c} \{\text{blue triangle}, \text{red triangle}\} \\ \text{set B} \end{array} = \begin{array}{c} \{(\text{blue circle}, \text{red triangle}), (\text{blue circle}, \text{blue triangle}), \\ (\text{black circle}, \text{red triangle}), (\text{black circle}, \text{blue triangle}), \\ (\text{red circle}, \text{red triangle}), (\text{red circle}, \text{blue triangle})\} \\ \text{set of all ordered pairs, } A \times B \\ A \times B = \{(a, b) \mid a \in A \text{ and } b \in B\} \end{array}$$

Let's say a relation exists between the reds:

**Relation R =  $\{(\text{red circle}, \text{red triangle})\}$**

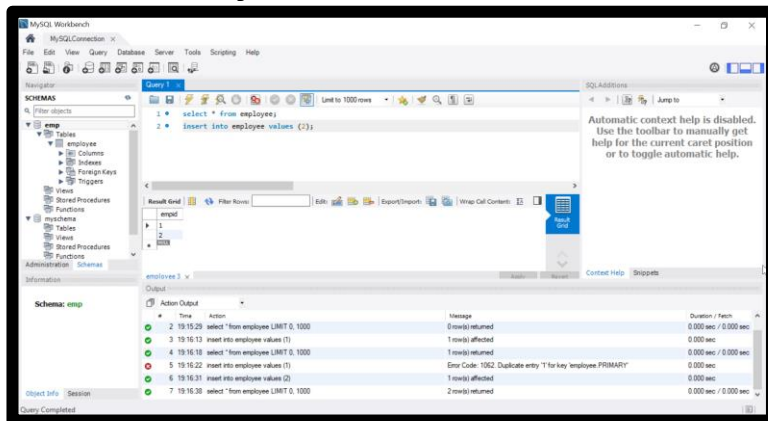

## Relational Data Model

id	name
1	sd
1	vv
2	sd
2	vv
3	sd
3	vv

Vs

id	name
1	sd
2	vv

## MySQL – An RDBMS

Attendance relation  $\{(1,1), (2,1)\}$  is same as the table

	studentid	sessionid
▶	1	1
	2	1

# Summary: Vector Space Model

## Model Documents as Vectors

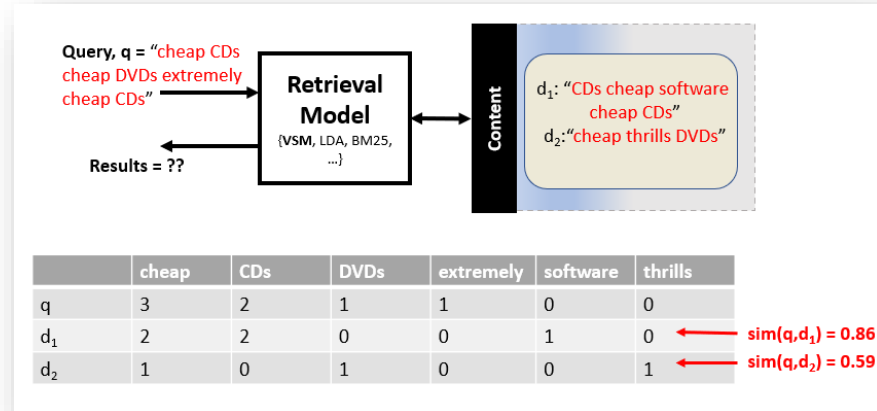

## Compute Similarity

$$\cos(\theta) = \frac{d_j \cdot q}{||d_j|| ||q||}$$

## A Worked-Out Example

# Summary: Probabilistic Model

Document	$P(R=0   d, q)$	$P(R=1   d, q)$
Taj	0.5	0.5
Taj Mahal	0	1
Taj Tea	1	0

$$RSV = \prod_{t: x_t = q_t = 1} \frac{p_t(1 - u_t)}{u_t(1 - p_t)}$$

RSV is used for ranking documents.

### Research

My research interest is in building **Search Engines**. How does Google work? How to search trillions of documents within microseconds? How to evaluate if Google is better or Bing? Broadly, **Information Retrieval** is the field of study that investigates these questions. My current focus is on investigating the techniques to search for source code. You will see me discussing Programming Languages, Program Analysis and Software Engineering. More about my research is [here](#).

If you are looking for an answer to an even more fundamental and important question: Why to study information retrieval?, enjoy the [video](#) from my students of the 2018 IR offering at IIITS - Mounika, Parkhi and Pragna.

# The Blind Men and the Elephant

The First approached the Elephant,  
And happening to fall  
Against his broad and sturdy side,  
At once began to bawl:  
“God bless! but the Elephant  
Is very like a wall!”

The third approached the animal,  
And happening to take  
The squirming trunk within his hands,  
Thus boldly up and spake:  
“I see,” quoth he, “the Elephant  
Is very like a Snake!”

The Second, feeling of the tusk,  
Cried, “Ho! what have we here  
So very round and smooth and sharp?  
To me ’tis mighty clear  
This wonder of an Elephant  
Is very like a spear ! ”

The Fourth reached out an eager hand,  
And felt about the knee.  
“What most this wondrous beast is like  
Is mighty plain,” quoth he;  
“ ’Tis clear enough the Elephant  
Is very like a tree!”
